

## Recommendation letter

To whom it may concern,

I had the privilege to supervise Karam Matar and Abduvohid Ilhomov in their bachelor thesis at Blekinge Institute of Technology (BTH). In their work, they worked closely with the company Iquest, developing a multi-agent, large language model (LLM), driven architecture called ACID bot that interacts with the company's project management system to automatically review, update, and fix software issues. This system is complementary to manual practices and is perceived to provide tangible efficiency gains for the company. In addition, the work provided tangible research insights for academia through a case study of the LLM-technology's application in industrial practice.

The students' thesis work was exemplary, keeping both academic and industrial supervisors informed continuously, whilst working independently, solving both technical and research related challenges in a professional and efficient manner. This is also reflected in the students' grade on their thesis work.
